
Project Title: Script-Controlled ACL – Restrict Record Access Based on Field Value

Date: 29 September 2026

Team ID: SWTID-2026-2246

PHASE 8 – PROJECT DEMONSTRATION

1. Introduction:

The Project Demonstration phase presents the completed ServiceNow project and explains its purpose, implementation, working process, and final output.

The demonstration will show how ACLs, roles, scripts, and branch-based conditions are used to control access to the **Institution Details** table.

2. Project Purpose

The purpose of this project is to provide controlled access to institutional records.

The system ensures that:

- Authorized users can perform permitted operations.
 - EEE users can access permitted EEE records.
 - Unauthorized users are restricted.
 - Create, Write, and Delete operations are controlled through separate roles.
 - Administrators have full access.
-

3. Project Benefits:

The project provides:

- Improved data security.
 - ~~Control-based~~ Branch-based record
 - restriction. Controlled CRUD
 - operations. Reduced
 - unauthorized access. Flexible
 - ACL configuration.
 - Better protection of institutional information.
-

4. Demonstration Requirements:

The project demonstration video should include:

1. Student introduction.
 2. Project name.
 3. Project purpose.
 4. Project benefits.
 5. ServiceNow environment.
 6. Custom table.
 7. Table fields.
 8. Sample records.
 9. User roles.
 10. Read ACL.
 11. ACL script.
 12. Branch condition.
 13. Create, Write, and Delete ACLs.
 14. Testing.
 15. Final output.
-

5. Demonstration Procedure:

Step 1 – Introduction

Start the video by introducing yourself.

Demo Script:

“Hello, I am Uma. My project title is Script-Controlled ACL – Restrict Record Access Based on Field Value. This project is developed using ServiceNow Access Control Lists to provide secure and role-based access to institutional records.”

Step 2 – Explain the Purpose

Say:

“The main purpose of this project is to restrict access to records based on user roles and branch values. In this project, EEE records are protected using ACL configuration, while administrators have full access.”

Step 3 – Open ServiceNow

Show the ServiceNow instance.

Explain:

“This is my ServiceNow development environment. I have implemented the complete project in this instance.”

Step 4 – Show Institution Details Table

Navigate to the **Institution Details** table.

Show the fields:

- Student Roll Number •

Student Name

- Faculty Name

- Branch
- Email
- Phone Number
- Description

Explain:

“This custom table stores student and institutional information. The Branch field contains EEE, ECE, and CSE values.”

Step 5 – Show Sample Records

Display the records containing:

- EEE
- ECE
- CSE

Explain:

“I created sample records with different branch values to test the access-control rules.”

Step 6 – Show Roles

Show the custom roles:

- bb1
- bb2
- bb3
- bb4

Explain:

“Different roles are used to control different operations. bb1 is used for Read, bb2 for Create, bb3 for Write, and bb4 for Delete.”

Step 7 – Demonstrate Read ACL

Open the Read ACL for:

u_institution_details

Show:

- Operation: Read
- Role: bb1
- Advanced: Yes
- Data Condition: **Branch is EEE**
- Script

Explain:

“The Read ACL requires the bb1 role. The data condition restricts the applicable records to the EEE branch. The script allows administrators and users with the bb1 role.”

Step 8 – Show the Script

Show the configured script:

```
(function () {  
    if (gs.hasRole('admin')) {  
        return true;  
    }  
    if (gs.hasRole('bb1')) {  
        return true;  
    }  
    return false;  
})();
```

Explain:

“The script checks the user's role. Administrators are allowed full access, while users with the bb1 role are allowed through the Read ACL. The Branch is EEE data condition provides the branch-level restriction.”

Step 9 – Demonstrate Create ACL

Show the Create ACL.

Explain:

“The Create ACL requires the bb2 role. This controls which users can create Institution Details records.”

Step 10 – Demonstrate Write ACL

Show the Write ACL.

Explain:

“The Write ACL requires the bb3 role. This controls editing of permitted records.”

Step 11 – Demonstrate Delete ACL

Show the Delete ACL.

Explain:

“The Delete ACL requires the bb4 role. This controls deletion of permitted records.”

6. Access Testing Demonstration:

Test 1 – Administrator

Show the administrator accessing records.

Explain:

“As an administrator, I can access all records, including EEE, ECE, and CSE records.”

Test 2 – EEE User

Log in or impersonate the EEE user with the bb1 role.

Show the Institution Details records.

Explain:

“The EEE user with the bb1 role can access the permitted EEE records, while non-EEE records are restricted by the configured branch condition.”

Test 3 – Unauthorized User

Use a user without the required role.

Explain:

“A user without the required permission cannot access the protected records.”

Test 4 – CRUD Permissions

Demonstrate the different roles where applicable:

bb2 → Create

bb3 → Write

bb4 → Delete

Explain:

“The Create, Write, and Delete operations are separately controlled using their respective roles.”

7. Final Output:

Show the final working system.

Explain:

“The final output demonstrates a working ServiceNow ACL system that controls record access based on user roles and the Branch field.”

8. Project Workflow:

Show the workflow diagram created for the project:

UserLogin → AccessInstitutionDetails → Check User Role → Check ACL → Check Branch Condition → Access Granted / Access Denied

Explain this briefly during the video.

9. GitHub Repository:

Show your GitHub repository containing the project documentation.

Repository:

script-controlled-acl-servicenow

The repository contains the projectfiles and the eight project phases.

10. Demonstration Video:

After recording the demonstration:

1. Upload the video to Google Drive.
2. Open the video's **Share** option.
3. Change General Access to **Anyonewith the link**.
4. Set permission to **Viewer**.
5. Copy the link.

6. Add the link to the required SkillWallet project submission.

Demo Video Link

Google Drive Demo Link:

https://drive.google.com/file/d/1lmy7517GNUG7uu_3rplRwkNKcy_omKG3/view?usp=drive_link

11. Final Conclusion:

The project demonstration shows the complete implementation and working of the **Script-Controlled ACL** system in ServiceNow.

The project demonstrates how **roles, ACLs, scripts, and branch-based data conditions** can be combined to provide controlled access to institutional records.
